

Useful Web APIs

Geolocation API

- Provides location information about the device, allowing websites to determine a user's geographic position.
- Use case: Find nearby services or show weather based on user location.

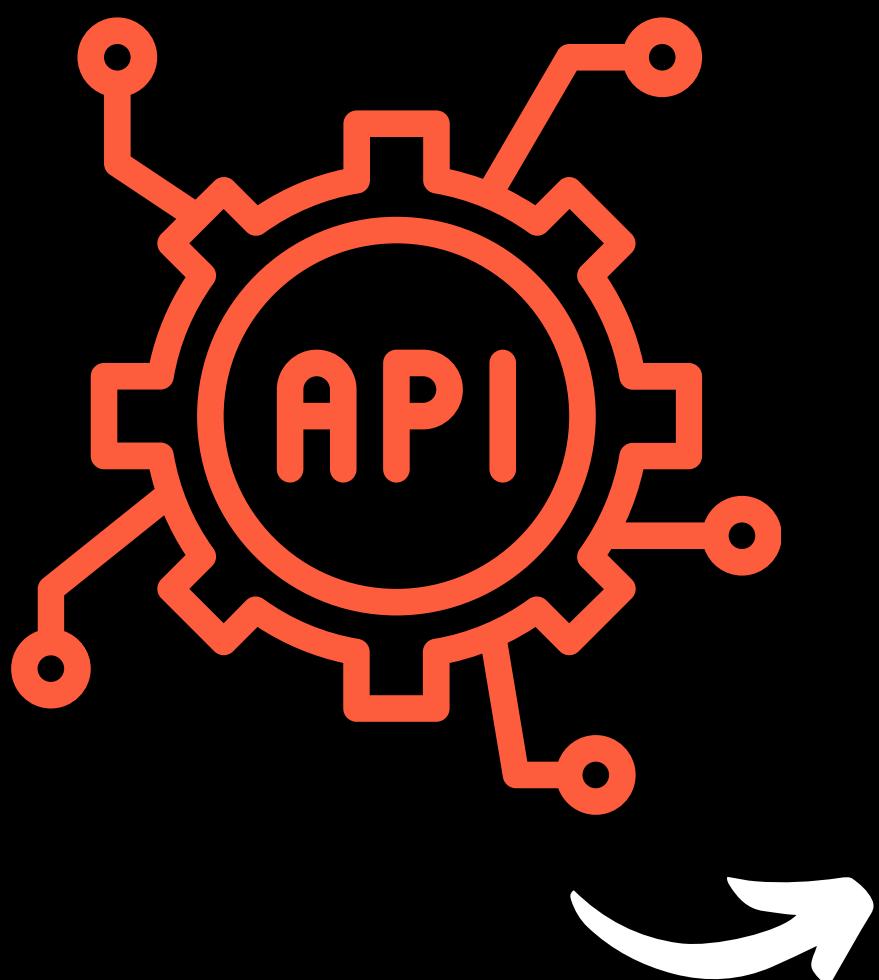

Fetch API

- A modern, promise-based API for making HTTP requests, replacing XMLHttpRequest.
- Use case: Fetching data from external APIs or submitting forms without reloading the page.

Web Storage API

- Includes localStorage and sessionStorage, allowing you to store key-value pairs in the browser.
- Use case: Store user preferences, tokens, or session data across page reloads or sessions.

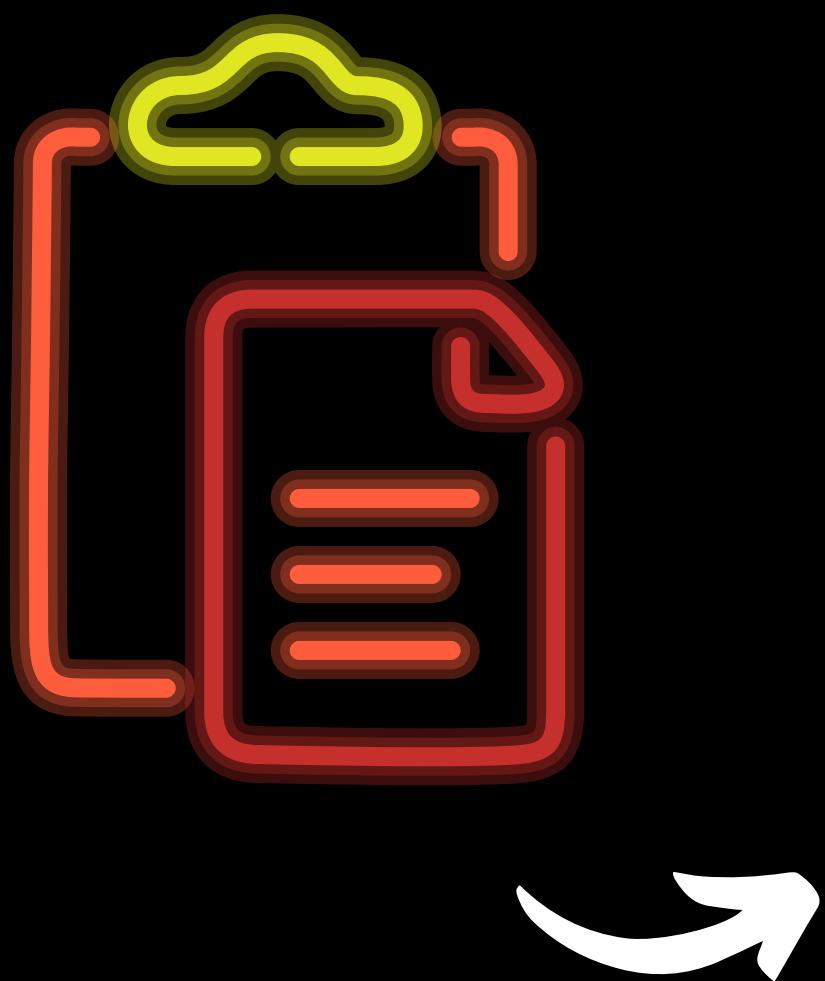

Notification API

- Enables web apps to send notifications to the user, even when the app is not in focus.
- Use case: Notify users of important updates, new messages, or reminders.

Clipboard API

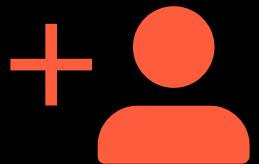

- The Clipboard API allows web applications to read from or write to the system clipboard. It's useful for copying or pasting text or other content between the clipboard and your web app.
